

Interview Guide: Expert Evaluation of Storytelling System (September-October 2025)

Session Format:

Microsoft Teams (audio recorded), one interviewer , one note taker

Introduction & Consent

- Welcome and thank you for taking part in this evaluation. I am [*presentation*] and will lead the conversation, and [*name*] will take notes [*presentation*].
- Brief explanation of the study:

This session is part of our research on “Collaborative Storytelling in Argument-based Micro-Dialogues to improve Health”, we are studying the possibilities and challenges when using AI to support reflection and motivation in everyday life about choices of activities that may improve health. This by generating personalised stories based on the activities a person has done in the past. We envision that the person has logged activities in an app, activities which the AI system then has information about when responding to the person’s requests. Such a storytelling functionality could be embedded in an app that has such information about the person.

Since you are an expert in a domain relevant for this, and have experience from developing technology for supporting people in daily activities, we would like to learn your thoughts on the generated stories and the system’s potential use with different groups, especially older adults. View this as a co-design moment, the system you will try is a first version and aimed to trigger thoughts.

As outlined in the consent form, the session will be audio recorded for analysis.

REMINDER: PRESS RECORD!

- Your participation is voluntary, and your responses will be kept strictly confidential. No personal or identifiable information will be shared in publications or presentations. Please remember that there are no right or wrong answers here. We are interested in your honest impressions, critical reflections, and suggestions for improvement. Do you have any questions before we begin?

Session Structure

First, you will receive a link to the system. You will register as a user, log a few activities that you choose so that the system has a basis of information, and then the system will generate stories based on the information and predefined questions (prompts) aimed to mirror different purposes of use. You will see one story at the time, and in the system there will be a few evaluation questions related to the story. You are welcome to “think aloud” when you are testing the system.

In addition to the questions embedded in the system about each story, we will have a conversation about the storytelling functionality in general and thoughts that come up.

REMINDER: SEND STORYTELLING SYSTEM LINK

1. The participant creates an account

- *instruction* - no need to use a real e-mail address

2. The participant reads instructions in the user interface

- *observation* - the researchers notes whether if they understand the instructions and are able to move forward, and what assistance/instruction they need if not, what is causing confusion.

3. The participant create activities

- *observation* - do they understand the categories of activities? Distinction between pre-defined activities and the ones they create themselves? Do they create own motives, is this something they find valuable? Other reflections about “motives”? comments on the social aspect “with someone”? the researchers notes whether if they understand the instructions and are able to move forward, and what assistance/instruction they need if not, what is causing confusion.

4. The participant generates stories – waiting time

- *interview* - opportunity to listen and pick up on reflections they have had so far: can be about the system, the types of activities, relevance for their user group, own experience, etc
- *Question 4a:*

5. The participant reads the story (for each story:)

- *observation* - how do they react to the story? Spontaneous reflections?

- *Question 5a*: What is your overall impression of the story you just read?
(Does it feel personal, relevant?)
 - i. Prompt: Would you consider it persuasive, reflective, or motivational in nature? Why or why not?

6. The participant answers the predefined questions (for each story:)

- *observation* - do they understand the questions, can they answer them, are they relevant?
- *Question 6a*: It is important to note that some elements of the story may not be entirely accurate, since language models (chatGPT) occasionally add details. How do you feel about that? Do you think a story can still be useful even if not every part is factually true?

7. After all stories are done, summative reflections

- *Question 7a*: The system generates stories that reflect on past or future activities. What is your impression of this approach?
 - Prompt i) What do you see are the limitations of this approach?
 - Prompt ii) what are the potentials?
- *Question 7b*: If we developed such a storytelling functionality further, what do you think it should look like to support older adults in performing and participating in meaningful activities?
 - Prompt: f you imagine this to be used by older adults, where do you see potential and where do you see difficulties?
- *Question 7c*: Can you imagine how a system embedding such storytelling functionality could be embedded into practice, eg., in elder care, coaching, or therapy?
- *Question 7d*: Are there particular situations or types of clients where such a storytelling functionality could be useful or not useful?
- *Question 7e*: What challenges or risks in using such a storytelling functionality do you foresee?
- *Question 7f*: what features or kinds of support would you want in a digital tool that uses storytelling to encourage healthy, meaningful, or recovery-oriented activities?
- *Question 7g*: Can you think of situations in your own work or daily practice where such a storytelling functionality might be supportive?

Part 1 : Ground participants in reflection and get thoughts on activity planning(

1. What kinds of everyday or meaningful activities do you usually recommend or see older adults engaging in?
(Categories: social, physical, recovery-related, etc.)
2. When helping someone plan activities for the coming week, what aspects do you consider important?
3. Imagine a digital system designed to remind, summarize, or reflect on such activities. What would you expect it to provide, and what would make it useful for you or for those you work with?

Closing

Before we finish, do you have any final reflections or suggestions that we have not yet discussed?

Thank you very much for your time, thoughtful contributions, and willingness to explore this new approach with us.
